- Update Wrap -Up

“Chewing gum will stay in your stomach for 7 years” – “No it won’t. It’s true that it doesn’t digest but that doesn’t mean it lingers in your stomach forever. It will come out with everything else, probably looking a lot like it did when it first went down.”

“Dropping a penny from the Empire State Building would kill someone” – “Pennies only weigh about a gram and they tumble as they fall so the air resistance is significant. If it reaches its terminal velocity it would be falling at about 100 miles/hour. So when it finally hit you on the head with about 1 foot-pound of energy it would hurt a little but you would quickly forget about it.”
